The VIPRION® 2400 Platform

About the platform

The VIPRION® 2400 system provides you with the flexibility and feature-rich capabilities of F5® products on a powerful and highly-extensible hardware platform. With this platform, you install and configure multiple F5 products using hot-swappable blades. This provides you with the ability to add, remove, or change the platform's configuration to best fit your network. Many components are available for you to add, remove, or change including the blades, power supplies, fan tray, and more. This configuration allows for an extremely robust and flexible system that can manage large amounts of application traffic, and remain operational even if one of its components goes offline.

VIPRION platforms include two types of components: blades, which provide the hardware and software needed to manage network traffic, and a chassis, which houses the blades.

The VIPRION 2400 platform supports either AC or DC power. If you ordered DC power as a factory option, the platform comes pre-installed with DC power supplies. If you ordered DC power supplies from F5 as an upgrade to an AC-powered platform, you have to switch out the AC power supplies for DC power supplies.

Important: The chassis and blades are shipped in separate boxes. The blades are not designed to be shipped inside a chassis.

Although the VIPRION 2400 platform is highly extensible and designed to be easy to implement, familiarity with the platform components can help ensure that you install and integrate the platform successfully and effectively.

About the chassis

The chassis is the housing unit that contains all of the components necessary for the VIPRION® 2400 platform to operate effectively.

2. Power supply 2
3. Blades (1-4)

The fan tray is on the back of the chassis.

Figure 2: Back view of the chassis

**About the blades**

A blade is the primary component that handles the traffic management within the VIPRION® platform. You can install up to four blades in a VIPRION 2400 chassis. These blades comprise a group, known as a cluster. The chassis includes blanks in the slots where blades are not installed.

Blanks must be installed in all unused slots, as they help ensure proper airflow within the chassis and EMI compliance of the unit.

USB LCD module

An external USB LCD module is available for use with the VIPRION 2000 Series platform.

*Note:* The USB LCD module is an optional device that is not included with the platform by default. It works only with VIPRION® 2000 Series platforms.

Using the USB LCD module

You can connect a USB LCD module to the primary blade in a VIPRION® 2000 Series chassis and use the module to configure and manage the unit without attaching a console or network cable.

1. Insert the plug into one of the two USB ports located on the front of the primary blade (the blade on which the Primary LED is lit).
   The USB LCD module powers on and displays BIG-IP® software information.
2. Press the Check button to clear any alerts on the LCD screen.
You must clear any alerts on the screen before you can use the LCD module.

3. Press the X button to put the LCD in Menu mode.
   The Left Arrow, Right Arrow, Up Arrow, and Down Arrow buttons are functional only when the LCD is in Menu mode.

Pausing on a screen

Normally, the screens cycle on the LCD module at a constant rate, but you can pause on a specific screen.
   Push the Check button to switch the LCD screen between Hold and Rotate modes.
   In Hold mode, a single screen is displayed. The Rotate mode changes the screen that is displayed on the LCD screen every four seconds.

Clearing alerts

Use the LCD control buttons to clear alerts from the LCD screen.
   Press the Check button to clear any alerts on the LCD screen.
   You must clear any alerts on the screen before you can use the LCD module.

About LCD menus

There are three menus on the LCD module. You can configure the display options to meet your needs.

Options menu

You can use the Options menu to adjust the display properties of the LCD module.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heartbeat</td>
<td>Enables (checked) or disables (unchecked) the heartbeat panel on the LCD. This heartbeat does not affect the failover mechanism of the system.</td>
</tr>
<tr>
<td>Backlight</td>
<td>Specifies an LCD screen backlighting option. Select from these options:</td>
</tr>
<tr>
<td></td>
<td>• ON enables the backlight.</td>
</tr>
<tr>
<td></td>
<td>• GRAY enables the software to specify when the backlight is illuminated.</td>
</tr>
<tr>
<td></td>
<td>• OFF disables the backlight.</td>
</tr>
<tr>
<td>Contrast</td>
<td>Sets the contrast of the LCD.</td>
</tr>
<tr>
<td>On Brightness</td>
<td>Adjusts LCD backlight brightness.</td>
</tr>
<tr>
<td>Off Brightness</td>
<td>Controls the brightness of the LCD when the backlight is off.</td>
</tr>
</tbody>
</table>

Screens menu

You can use the Screens menu to specify the information that is displayed on the default screens.
System menu

You can use the System menu to configure the management interface on both clusters and blades. This menu also provides various options for the hardware.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Suboptions</th>
</tr>
</thead>
</table>
| Cluster  | Configures the cluster IP address, netmask, and default gateway for managing the cluster. | Cluster Mgmt<br>Select from these suboptions:<br>  
  • Cluster IP sets the cluster IP address.<br>  
  • Cluster IP Mask sets the netmask.<br>  
  • Gateway sets the default gateway for managing the cluster.<br>  
  • Commit saves your changes. |
|          | Configures the management IP addresses of the blades within the cluster.    | Cluster Mbrs<br>Select from these suboptions:<br>  
  • Blade [1-4] Mgmt<br>  
    • Blade Mgmt IP sets the management IP address of the selected blade within the cluster.<br>  
    • Commit saves your changes. |

Indicator LEDs

The VIPRION® 2400 platform includes indicator LEDs in three locations: on the individual blades, on the power supplies, and on the fan tray.

Indicator LED actions

The behavior of the LEDs indicate system or component status.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off (none)</td>
<td>LED is not lit and does not display any color.</td>
</tr>
<tr>
<td>Solid</td>
<td>LED is lit and does not blink.</td>
</tr>
<tr>
<td>Blinking</td>
<td>LED turns on and off at a regular frequency.</td>
</tr>
<tr>
<td>Intermittent</td>
<td>LED turns on and off with an irregular frequency and might appear solid.</td>
</tr>
</tbody>
</table>
Blade indicator LEDs

The blade LEDs indicate whether the blade is a primary or secondary blade, and show alarm and blade status.

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Indicates that the blade is a primary blade for a cluster.</td>
</tr>
<tr>
<td>Secondary</td>
<td>Indicates that the blade is a secondary blade for a cluster.</td>
</tr>
<tr>
<td>Status</td>
<td>Indicates the state of the system.</td>
</tr>
<tr>
<td>Alarm</td>
<td>Indicates a non-specific alert level. Use SNMP traps, system logs, or the LCD display for more information.</td>
</tr>
</tbody>
</table>

Blade standard operating states

The blade LEDs indicate the operating state of a blade.

*Note: On power up, the Status LED of each blade turns amber. When the BIG-IP® software boots successfully, the Status LED changes to green.*

<table>
<thead>
<tr>
<th>System state</th>
<th>Primary LED (PRI)</th>
<th>Secondary LED (SEC)</th>
<th>Status LED (STA)</th>
<th>Alarm LED (ALM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active mode</td>
<td>Off/None</td>
<td>Off/None</td>
<td>Green solid</td>
<td>Off/None</td>
</tr>
<tr>
<td>Powered off</td>
<td>Off/None</td>
<td>Off/None</td>
<td>Off/None</td>
<td>Off/None</td>
</tr>
</tbody>
</table>

Blade LED status conditions

The blade LEDs indicate specific operating conditions, such as high availability (HA) status, or when a blade is shut down, reset, or not properly seated.

<table>
<thead>
<tr>
<th>Blade state</th>
<th>Primary LED</th>
<th>Secondary LED</th>
<th>Status LED</th>
<th>Alarm LED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blade is fully functional and operating as the primary in a high availability (HA) configuration</td>
<td>Green solid</td>
<td>Off/None</td>
<td>Green solid</td>
<td>Off/None</td>
</tr>
<tr>
<td>Blade is fully functional and operating as a secondary in a high availability (HA) configuration</td>
<td>Off/None</td>
<td>Amber solid</td>
<td>Green solid</td>
<td>Off/None</td>
</tr>
<tr>
<td>User-initiated blade power down</td>
<td>Green blinking</td>
<td>Green blinking</td>
<td>Green blinking</td>
<td>Off/None</td>
</tr>
<tr>
<td>Blade shut down due to thermal overtemp limit</td>
<td>Amber blinking</td>
<td>Amber blinking</td>
<td>Amber blinking</td>
<td>Red solid</td>
</tr>
<tr>
<td>Blade not seated properly</td>
<td>Amber blinking</td>
<td>Amber blinking</td>
<td>Amber solid</td>
<td>Red solid</td>
</tr>
</tbody>
</table>
### Fan tray indicator LED

The fan tray LED indicates the status of the fan tray.

<table>
<thead>
<tr>
<th>Action</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amber solid</td>
<td>Indicates that either the fan tray controller is powering on, or one or more fans are not spinning within the specified RPM range.</td>
</tr>
<tr>
<td>Green solid</td>
<td>Indicates that the fan tray controller is fully functional, and all fans are spinning within the specified RPM range.</td>
</tr>
</tbody>
</table>

### AC power supply indicator LEDs

The AC power supply LEDs indicate the status of the power supply and power input.

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>AC</td>
<td>Indicates that AC input voltage is operational (on) or non-functioning (off).</td>
</tr>
<tr>
<td>DC</td>
<td>Indicates that DC output voltage is operational (on) or non-functioning (off).</td>
</tr>
<tr>
<td>FAIL</td>
<td>Indicates these conditions:</td>
</tr>
<tr>
<td></td>
<td>• No AC input</td>
</tr>
<tr>
<td></td>
<td>• Fan failure</td>
</tr>
<tr>
<td></td>
<td>• Power supply errors or failures (for example, high temperature, high voltage)</td>
</tr>
<tr>
<td>SYS</td>
<td>Indicates these conditions:</td>
</tr>
<tr>
<td></td>
<td>• Amber status when the fan tray is powered, and one of these conditions are true:</td>
</tr>
<tr>
<td></td>
<td>• AC failure</td>
</tr>
<tr>
<td></td>
<td>• DC failure</td>
</tr>
<tr>
<td></td>
<td>• Any other power supply faults, such as fan failure (indicated by the FAIL LED)</td>
</tr>
<tr>
<td></td>
<td>• Green status when the fan tray is powered, and the power supply is fully functional (AC and DC are OK; no other faults indicated by the FAIL LED).</td>
</tr>
</tbody>
</table>

### DC power supply indicator LEDs

The DC power supply LEDs indicate the status of the power supply and power input.

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
<td>Indicates that DC input voltage is operational (on) or non-functioning (off).</td>
</tr>
<tr>
<td>OUT</td>
<td>Indicates that DC output voltage is operational (on) or non-functioning (off).</td>
</tr>
<tr>
<td>FAIL</td>
<td>Indicates these conditions:</td>
</tr>
<tr>
<td></td>
<td>• No DC input</td>
</tr>
<tr>
<td></td>
<td>• Fan failure</td>
</tr>
</tbody>
</table>
### LED Status

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS</td>
<td>Indicates these conditions:</td>
</tr>
<tr>
<td></td>
<td>• Amber status when the fan tray is powered, and one of these conditions are true:</td>
</tr>
<tr>
<td></td>
<td>• DC failure</td>
</tr>
<tr>
<td></td>
<td>• Any other power supply faults, such as fan failure (indicated by the FAIL LED)</td>
</tr>
<tr>
<td></td>
<td>• Green status when the fan tray is powered, and the power supply is fully functional (DC is OK; no other faults indicated by the FAIL LED).</td>
</tr>
</tbody>
</table>

### LED alert conditions

The Alarm LED indicates when there is an alert condition on the system.

*Note:* The Alarm LED might continue to display until alerts are cleared using the LCD module.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System situation</td>
<td>Alarm LED behavior</td>
</tr>
<tr>
<td>Emergency</td>
<td>Red blinking</td>
</tr>
<tr>
<td>Alert or Critical</td>
<td>Red solid</td>
</tr>
<tr>
<td>Error</td>
<td>Amber blinking</td>
</tr>
<tr>
<td>Warning</td>
<td>Amber solid</td>
</tr>
</tbody>
</table>

### Defining custom alerts

The `/etc/alertd/alert.conf` and the `/config/user_alert.conf` files on the VIPRION® system define alerts that cause the indicators to change. The `/etc/alertd/alert.conf` file defines standard system alerts, and the `/config/user_alert.conf` file defines custom settings. You should edit only the `/config/user_alert.conf` file.

1. Open a command prompt on the system.
2. Change to the `/config` directory.
   
   `cd /config`

3. Using a text editor, such as vi or Pico, open the `/config/user_alert.conf` file.
4. Add these lines to the end of the file:

   ```
   alert BIGIP_MCPD_MCPDERR_POOL_MEMBER_MON_DOWN "Pool member (.*?):(.*?) monitor status down."
   {  
     snmptrap OID=".1.3.6.1.4.1.3375.2.4.0.10";  
     lcdwarn description="Node down" priority="1"
   }
   alert BIGIP_MCPD_MCPDERR_NODE_ADDRESS_MON_DOWN "Node (.*?) monitor status down."
   {  
     snmptrap OID=".1.3.6.1.4.1.3375.2.4.0.12";  
     lcdwarn description="Node address down" priority="1"
   }
   ```
5. Save the file and exit the text editor.
   The front panel LEDs now indicate when a node is down.

Platform interfaces

Every platform includes multiple interfaces. The exact number of interfaces that are on the system depends on the platform type.

Each interface on the platform has a set of properties that you can configure, such as enabling or disabling the interface, setting the requested media type and duplex mode, and configuring flow control.

About blade interfaces

B2100 Series blades

The B2100 Series blades have eight 10GbE SFP+ optical interfaces that are connected internally. The SFP+ connectors can each support 10G speed with an F5®-branded optical SFP+ module or 1000 Mbit speed with an F5-branded optical SFP 1GbE module installed.

B2250 blade

The B2250 blade has four 40GbE QSFP+ fiber interfaces that support up to four 40GbE ports (2.1-2.4), which you can use as individual 10GbE ports or as 40GbE ports, depending on how you bundle the ports. There are LEDs for both 10GbE and 40GbE operation.

Figure 6: B2250 blade interfaces and LEDs

Supported transceivers

For current specification information for optical transceivers that are supported by this platform, see F5 Platforms: Accessories at support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/f5-plat-accessories.html.
About 40GbE interfaces

On VIPRION® platforms that include 40GbE interface ports, you can use the ports as a single 40GbE port or as four 10GbE SFP+ ports.

*Note:* Only the VIPRION B2250 blade includes 40GbE interface ports.

40 GbE QSFP+ components

*Note:* If you are using a breakout cable for 10GbE connectivity, you should use the supported distance as detailed in the Specifications for fiber QSFP+ modules section and not the Specifications for fiber SFP+ modules section in F5 Platforms: Accessories at support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/f5-plat-accessories.html.

![Figure 7: An example of a 40 GbE QSFP+ breakout cable](image)

You can order these 40 GbE QSFP+ components from F5®:

- QSFP+ breakout cables (MTP to LC), provided as a pair, in these lengths:
  - 1 meter (F5-UPG-QSFP+-1M-2)
  - 3 meter (F5-UPG-QSFP+-3M-2+)
  - 10 meter (F5-UPG-QSFP+-10M-2)
- F5-branded 40GbE QSFP+ transceiver modules (F5-UPG-QSFP+ and F5-UPG-QSFP+LR4)

Configuring bundling for 40GbE interfaces using tmsh

You can use `tmsh` to configure bundling for the 40GbE interfaces on the platform. When you disable bundling, you can use the 40GbE ports as individual 10GbE ports using a QSFP+ breakout cable.

1. Open the Traffic Management Shell (tmsh).
   ```
tmsh
   ```
2. Change to the network module.
   ```
net
   The command prompt updates with the module name:
   user@bigip01(Active) (/Common) (tmos.net) #.
   ```
3. Configure bundling for a specific interface, where `<interface_key>` is 2.1, 2.2, 2.3, or 2.4.
   ```
modify interface <interface_key> bundle [enabled | disabled]
   ```
**Configuring bundling for 40GbE interfaces using the Configuration utility**

You can use the Configuration utility to configure bundling for the 40GbE interfaces on the platform. When you disable bundling, you can use the 40GbE ports as individual 10GbE ports using a QSFP+ breakout cable.

1. On the Main tab, click **Network > Interfaces**.
   This displays the list of available interfaces.
2. Click an interface name.
   The properties screen for that interface opens.
3. From the **Bundled** list, select whether to enable or disable bundling.
4. Click **Update**.

**About managing interfaces**

You can use `tmsh` or the Configuration utility to configure platform interfaces.

**Viewing the status of a specific interface using tmsh**

You can use `tmsh` to view the status of a specific interface on a platform.

1. Open the Traffic Management Shell (tmsh).
   ```
tmsh
   ```
2. Change to the network module.
   ```
net
   ```
   The command prompt updates with the module name:
   ```
user@bigip01(Active)(/Common)(tmos.net)#
   ```
3. Display the current status of a specific interface.
   ```
show interface <interface_key>
   ```
   This is an example of the output that you might see when you run this command on interface 1/1.2 (slot 1, interface 1.2):

<table>
<thead>
<tr>
<th>Name</th>
<th>Status</th>
<th>Bits In</th>
<th>Bits Out</th>
<th>Pkts In</th>
<th>Pkts Out</th>
<th>Drops</th>
<th>Errs</th>
<th>Media</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1.2</td>
<td>up</td>
<td>637.8G</td>
<td>5.8M</td>
<td>1.1G</td>
<td>5.7K</td>
<td>1.1G</td>
<td>0</td>
<td>10000SR-FD</td>
</tr>
</tbody>
</table>

**Viewing the status of all interfaces using tmsh**

You can use `tmsh` to view the status of all interfaces on the platform.
1. Open the Traffic Management Shell (tmsh).
   tmsh

2. Change to the network module.
   net
   The command prompt updates with the module name:
   user@bigip01(Active)(/Common)(tmos.net)#

3. Display the current status of all interfaces.
   show interface
   This is an example excerpt of the output that you might see when you run this command on B2000 Series blades:

   ┌───────────────┬───────────┬───┬───┬───┬───┬───────┬────────┐
   │ Net::Interface│ Name      │ Status │ Bits │ Bits │ Pkts │ Pkts │ Drops | Errs  │ Media  │
   ├───────────────┼───────────┼───────────┬───┬───┬───┬───┬───────┬─────────┼
   │               │ 1/1.1     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.2     │ up       │ 636.5G │ 5.5M │ 1.1G │ 5.4K │ 1.1G   │ 0      │ 10000SR-FD │
   │               │ 1/1.3     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.4     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.5     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.6     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.7     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.8     │ miss     │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │
   │               │ 1/1.9     │ uninit   │ 0   │ 0   │ 0   │ 0   │ 0     │ none   │

Viewing the status of all interfaces using the Configuration utility

   You can use the Configuration utility to view the status of all interfaces on the platform.

   1. On the Main tab, click Network > Interfaces.
      This displays the list of available interfaces.

   2. Click Statistics.
      The Statistics screen for all interfaces opens.

About interface media type and duplex mode

   All interfaces on the system default to auto-negotiate speed and full duplex settings. We recommend that you also configure any network equipment that you plan to use with the system to auto-negotiate speed and duplex settings. If you connect the system to network devices with forced speed and duplex settings, you must force the speed and duplex settings of the system to match the settings of the other network device.
**Important:** If the system is attempting to auto-negotiate interface settings with an interface that has the speed and duplex settings forced (that is, auto-negotiation is disabled), you will experience severe performance degradation. This applies to 10GbE and 40GbE interfaces.

By default, the media type on interfaces is set to automatically detect speed and duplex settings, but you can specify a media type as well. Use the following syntax to set the media type:

```plaintext
tmsh modify net interface <interface_key> media <media_type> | auto
```

If the media type does not accept the duplex mode setting, a message appears. If media type is set to `auto`, or if the interface does not accept the duplex mode setting, the duplex setting is not saved to the `/config/bigip_base.conf` file.

**Important:** Auto-MDI/MDIX functionality is retained when you manually configure an interface to use specific speed and duplex settings. You can use either a straight-through cable or a crossover cable when media settings are forced, and you will be able to successfully link to either DTE or DCE devices.

**Valid media types**

These media types are valid for the `tmsh interface` command.

*Note:* This platform might not support all of the media type options that are available in `tmsh`.

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10BaseT half</td>
<td>10GBaseLR full</td>
</tr>
<tr>
<td>10BaseT full</td>
<td>10GBaseER full</td>
</tr>
<tr>
<td>100BaseTX half</td>
<td>10SFP+Cu full</td>
</tr>
<tr>
<td>100BaseTX full</td>
<td>40GBaseSR4 full</td>
</tr>
<tr>
<td>1000BaseT half</td>
<td>40GBaseLR4 full</td>
</tr>
<tr>
<td>1000BaseT full</td>

<td>no-phy</td>
</tr>
<tr>
<td>10GBaseSR full</td>
<td></td>
</tr>
</tbody>
</table>

**Viewing valid media types for an interface**

You can use `tmsh` to view the valid media types for an interface.

*Note:* This platform might not support all of the media type options that are available in `tmsh`.

1. Open the Traffic Management Shell (`tmsh`).
   ```plaintext
tmsh
```
2. Change to the network module.
   ```plaintext
net
```
   The command prompt updates with the module name:
   ```plaintext
user@bigip01(Active) (/Common) (tmos.net)#.
```
3. Display the valid media types for a specific interface:
   ```plaintext
show running-config interface <interface_key> media-capabilities
```
Important: In all Gigabit Ethernet modes, the only valid duplex mode is full duplex.

This is an example of the output that you might see when you run this command on interface 1.3:

```
net interface 1.3 {
    media-capabilities-sfp {
        none
        auto
        1000T-FD
        1000LX-FD
        1000SX-FD
        1000CX-FD
        10000SR-FD
        10000LR-FD
        10000SFPUCU-FD
    }
}
```

Network interface LED behavior

The appearance and behavior of the network interface LEDs on the blades indicate network traffic activity, interface speed, and interface duplexity.

SFP+ port LED behavior

The appearance and behavior of the SFP+ optical interface LEDs indicate network traffic activity, interface speed, and interface duplexity.

**Transceiver module specifications**

For current specification information for optical transceivers that are supported by this platform, see *F5 Platforms: Accessories* at support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/f5-plat-accessories.html.

**Cable pinout specifications**

For current pinout information for this platform, see *F5 Platforms: Accessories* at support.f5.com/kb/en-us/products/big-ip_ltm/manuals/product/f5-plat-accessories.html.

**Always-On Management**

The Always-On Management (AOM) subsystem enables you to manage the VIPRION® 2400 system remotely using serial console, even if the host is powered down. The AOM Command Menu operates independently of the BIG-IP® Traffic Management Operating System® (TMOS).

*Note:* The available functionality and options in AOM vary depending on the platform type.

**AOM Command Menu options**

The AOM Command Menu provides the Always-On Management options for the VIPRION® 2400 platform.

*Note:* The availability of menu options varies depending on the platform type.

<table>

</tbody>
</table>

**Accessing the AOM Command Menu from the serial console**

You can access the AOM Command Menu through the host console shell (hostconsh) using the front panel serial console.

*Important:* The serial console is the only supported method for accessing AOM on this platform.

1. Connect to the system using the serial console.
2. Access the AOM Command Menu.
   
   Esc (  
   
   The AOM Command Menu displays.

**Capturing a blade console**

You can use the AOM Command Menu **Capture blade console** option to manage the other blades installed in the chassis.

1. Connect to the system using the serial console.
2. Open the AOM Command Menu.
   
   Esc (  
   
3. Type `C` to select the **Capture blade console** menu option.
4. When prompted to select a blade, type the slot number (1-4) for the blade that you would like to manage.

*Note:* If the specified blade's console is already being redirected, you will be prompted to confirm that you still want to capture the specified blade's console.

A message similar to this example confirms that you are now viewing the console for the specified blade:

*Connecting to blade in slot n...success.*
Platform Installation

About installing the platform

After you have reviewed the hardware requirements and become familiar with the VIPRION® 2400 platform, you can install the chassis.

**Warning:** Due to the weight of the platform, at least two people are required to install this chassis into a rack. Failing to use two people can result in severe personal injury or equipment damage.

**Important:** Before you install this platform, review the environmental guidelines to make sure that you are installing and using the platform into a compatible rack and in the appropriate environment.

**Important:** F5® strongly recommends that you install the chassis into a rack before you install any blades. This ensures that the weight of the chassis remains manageable as you install the chassis into a rack.

**Note:** After you install a blade, wait approximately one to two minutes before installing another to ensure that each blade has sufficient time to boot. When the Status LED is green, the blade is fully booted.

About general recommendations for rack mounting

Although not required, a 1U empty space between chassis makes it easier for you to remove the chassis from the rack in the event that the chassis requires service. A 1U space between chassis also provides additional cable routing options.

Leaving at least 100 mm of space from the front panel of the chassis to the rack front or rack door provides enough room for you to route the cables without excessive bending or insulation damage.

A shelf or similar device is required to support the chassis if only one person is installing the chassis.

**Warning:** Due to the weight of the platform, at least two people are required to install this chassis into a rack. Failing to use two people can result in severe personal injury or equipment damage.

**Important:** This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

Hardware included with the AC-powered chassis

The VIPRION® 2200 Series AC-powered chassis should include all of the hardware components listed here.
Hardware included with blades

VIPRION® B2000 Series blade should include all of the hardware components listed here.

Peripheral hardware requirements

For each platform, you might need to provide additional peripheral hardware. If you plan to remotely administer the system, it would be helpful to have a workstation already connected to the same subnet as the management interface.

<table>
<thead>
<tr>
<th>Type of hardware</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network hubs, switches, or connectors to connect to the platform network interface ports</td>
<td>You must provide networking devices that are compatible with the network interface ports on the platform. You can use either 10/100/1000/10000-Megabit or 40/100-Gigabit Ethernet switches.</td>
</tr>
<tr>
<td>External USB CD/DVD drive or USB flash drive</td>

</tr>
<tr>
<td></td>
<td>Note: F5 recommends that external CD/DVD drives be externally powered.</td>
</tr>
<tr>
<td>Serial console</td>
<td>You can remotely manage the platform by connecting to a serial console terminal server through the console port.</td>
</tr>
<tr>
<td></td>
<td>Important: In the event that network access is impaired or not yet configured, the serial console might be the only way to access the chassis.</td>
</tr>
</tbody>
</table>
## Unpacking the chassis

The VIPRION® 2400 chassis ships in a custom-designed package that protects the product during shipment and facilitates ease of removal when you are ready to install the chassis into a rack. Due to the weight of the chassis, there is a specific procedure that you must follow to ensure that you remove the chassis from its packaging safely and securely.

**Warning:** To ensure your safety and to prevent damage to the chassis, at least two people are required to remove this chassis from the shipping box.

1. If you have not already done so, open the top of the shipping box.

2. Remove the accessory box from the foam insert.
3. Remove the foam insert from the top of the chassis and remove the plastic wrap from the top of the chassis.

4. Use two people, and have each person grasp one handle and lift straight up to remove the chassis from the shipping box.

5. Carefully move the chassis to a flat surface and set it down until you are ready to install the chassis into a rack.

About installing the chassis

You should select a location for installing the VIPRION 2400 chassis that is easy to access for adding or removing power supplies, the fan tray, or blades. The location should also provide adequate ventilation to allow sufficient airflow through the platform. The platform employs a negative pressure fan system, which draws cold air in from the front of the chassis and exhausts hot air out the back of the chassis. After you have identified the intended location for the platform, you can install the chassis into the rack.

The VIPRION 2400 chassis comes pre-installed with mounting brackets and handles. The mounting brackets are attached to the front of the chassis, but you can move them to either the middle or back of the chassis, depending on the configuration of the rack. The handles make it easier to lift the chassis into position for rack mounting.
The chassis is designed for 19-inch racks. If you are installing into a wider rack, you will need to provide adapters. The four-point rack mounting rail kit will not work with 23-inch racks.

**Caution:** If you have not yet removed the chassis from the shipping box, F5® Networks highly recommends that you have at least two people remove the chassis from the box. This ensures your safety and prevents damage to the chassis.

**Caution:** Do not attempt to lift the enclosure by means of the fan tray module. In the process of doing so, the fan tray will pull free from the unit, with the potential of damaging the remaining chassis and fan tray.

**Important:** Before you install this platform, review the environmental guidelines to make sure that you are installing and using the platform into a compatible rack and in the appropriate environment.

**Important:** This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

### About the two-point rack mounting brackets

You can use the two-point rack mounting brackets if you are installing into a two-post rack.

The two-point rack mounting brackets are pre-installed on the chassis.

**Note:** You should use the two-point rack mounting brackets to install the platform only if you are installing into a two-post rack. For installing the platform into all other types of racks or cabinets, you should use the four-point rack mounting rail kit.

### Installing the chassis into a two-post rack

Before you install this platform, review the environmental guidelines to make sure that you are installing and using the platform in the appropriate environment.

**Important:** If you are installing the chassis into a rack that does not have threaded holes (for example, a square hole rack), you need to install cage nuts before you can install the chassis. You should install a minimum of three cage nuts per side.

After you have installed the two-point rack mounting brackets onto the chassis, you can install the chassis directly into a two-post rack.

**Warning:** Due to the weight of the platform, at least two people are required to install this chassis into a rack. Failing to use two people can result in severe personal injury or equipment damage.

1. Using two or more people, lift the chassis to the appropriate location on the rack.
2. Secure the two-point rack mounting brackets to the rack using a minimum of three manufacturer-provided rack screws per side.
   - The chassis must be fastened to the rack securely to provide adequate stability and prevent the chassis from falling out of the rack.
3. (Optional) You can remove the red handles from the top of the chassis.

After the chassis is installed into a rack, you can install the cable management system and supply power to the chassis.
About the four-point rack mounting rail kit

The four-point rack mounting rail kit helps ease installation and removal of the chassis from a rack. The rails snap into place in the rack, and no tools are required to install a platform using this kit. The rails are optimized for installation into square hole cabinets, but they can be installed in other cabinet styles, such as round hole cabinets, using the screws provided. The rails are easily converted to mount to either cabinet style.

The rail kit includes these parts:

- Two rail assemblies (left and right), which consist of an inner rail that you install onto the chassis and an outer rail that you install in the rack
- Eight #8-32 thumb screws
- Two cage nuts

Before you install this platform, review the environmental guidelines to make sure that you are installing and using the platform in the appropriate environment.

Figure 8: Four-point rack mounting rail kit

For information about installing the platform using the four-point rack mounting rail kit, see the instruction guide provided by the manufacturer, which is included with the kit hardware. After you slide the unit into the rack, use the thumbscrew on the bracket to lock the unit in place. If the thumbscrew does not reach the rack cage nut, insert a customer-provided rack screw through a slot in the bracket to lock the unit to the rack.

Figure 9: Four-point rack mounting brackets installed on a chassis
Warning: Due to the weight of the platform, at least two people are required to install this chassis into a rack. Failing to use two people can result in severe personal injury or equipment damage.

Important: The maximum rack mount depth supported by the four-point rack mounting rails is 38 inches (96.52 cm). Using the rails in a rack deeper than this might cause the brackets to be overextended and cause a structural failure.

After the chassis is installed into a rack, you can install the cable management system, and then supply power to the chassis. Optionally, you can remove the red handles from the top of the chassis.

Installing the cable management system

After you have installed and secured the chassis to a rack, you can install the cable management system.

1. Locate the cable routing brackets and covers included with the chassis.
   The brackets and covers are in an accessory box that is included with the chassis.

2. Attach the cable routing brackets to the appropriate location on the chassis (front, middle, or rear) by tightening the captive screws clockwise until they are completely secured.

   Note: You attach the cable management covers to the brackets after you connect the power supply cables to the power supplies and connect all other cables.

About grounding the chassis

You should ground the platform after you install it in a rack. The chassis grounding stud is located behind the nameplate on the front of the chassis.

Do not secure multiple bonding or grounding connectors with the same bolt. The grounding connectors do not need to be removed to perform service or installation procedures. You can connect other bonding or
grounding conductors to a grounding connector provided a reliable bond between the connector and the equipment is not disturbed during installation, service, or maintenance of the platform.

**Important:** All copper grounding cable compression-type terminal lugs used for grounding must meet all appropriate safety standards.

**Note:** The VIPRION 2400 platform must be grounded to a common bonding network (CBN).

---

**Figure 10: Chassis grounding stud**

---

**Connecting the chassis grounding stud to the ground terminal**

You will need these tools to properly ground the chassis:

- Crimping tool
- Single (AC) or double (DC) ring ground terminal lug
- For AC installations, one 14 AWG copper wire long enough to reach from the chassis to the common bonding network (CBN)
- For DC installations, one 8 AWG copper wire long enough to reach from the chassis to the common bonding network (CBN)

After the chassis is installed in the rack and before you provide power to the system, you need to connect the grounding hardware.

1. Use a #2 Philips screwdriver to remove the name plate located on the front of the chassis to expose the chassis grounding stud.
2. Remove the M6 Keps nut from the stud.
3. Use a crimping tool to crimp the copper ground wire to a single ring ground terminal lug.
4. Attach the single ring ground terminal lug to the chassis grounding stud.
5. Reinstall the M6 Keps nut to the grounding stud.
   - Use 16 to 18 inch-pounds (1.8 to 2.0 Newton-meters) of torque on the M6 Keps nut.
6. Connect the ground wire to a common bonding network (CBN).
7. Use a #2 Philips screwdriver to reinstall the name plate.
About powering the VIPRION 2400 AC platform

The AC platform ships with two power cords that you must use with the installed power supplies to power the chassis.

**Important:** Do not install blades or disconnect blades from the chassis before supplying power to the chassis.

**Important:** Do not use any power cords other than those specifically designed for the VIPRION 2400 platform.

**Caution:** The power supply cord is used as the main disconnect device; ensure that the socket-outlet is located or installed near the equipment and is easily accessible.

**Attention:** Le cordon d'alimentation est utilisé comme interrupteur général. La prise de courant doit être située ou installée à proximité de l'équipement et être facile d'accès.

**Caution:** This unit has more than one power supply cord. Disconnect two power supply cords before servicing to avoid electric shock.

**Attention:** Cet appareil comporte plus d'un cordon d'alimentation. Afin de prévenir les chocs électriques, débrancher les deux cordons d'alimentation avant de faire le dépannage.

Powering the AC platform

You can connect the power cables to the platform after you install the chassis into a rack.

1. On the front of the chassis, locate the power supplies.
2. Attach a power cord to the outlet and press firmly until it is fully seated.
3. Plug the power cord into an approved power source.
4. Repeat this process for each power supply in the chassis.
5. Guide the power cables through the cable routing brackets.
6. Attach the cable management covers to the cable routing brackets by using a Phillips screwdriver, if necessary.
About powering the VIPRION 2400 DC platform

If you ordered DC power as a factory option, your VIPRION® 2400 platform comes pre-installed with DC power supplies.

Before you power this VIPRION DC platform, see Guidelines for DC-powered equipment and Guidelines for VIPRION DC platform installation.

Connecting DC power to the platform

**Important:** Be sure that the DC power source is off and the ground lug is connected to the ground terminal before you connect the platform to the DC power source.

After you have assembled the DC input connector, you can connect the platform to the DC power source. When you connect the DC power source, you should also follow the safety requirements defined for your network operations center (NOC).

1. Plug the assembled DC input connector into the outlet of the DC power supply and press firmly until it is fully seated.
   
   If the connector does not readily insert into the power supply, you might need to manually align it.
2. Secure the DC input connector to the power supply by tightening the captive screw clockwise until it is secured to the power supply completely.

   **Note:** The top screw secures the DC input connector to the power supply, and the bottom screw secures the power supply to the chassis.

3. Connect the DC power cord to an approved power source.
   For more information about voltage input requirements, see *Chassis hardware specifications*.

4. Repeat this process for each power supply in the chassis.

5. Guide the power cables through the cable routing brackets.

6. Attach the cable management covers to the cable routing brackets by using a #2 Phillips screwdriver, if necessary.

7. Power on the DC power source.
   The system begins to boot.

---

### About installing blades

The VIPRION® 2400 chassis supports up to four B2000 Series blades.

   **Note:** *F5*® *does not support mixing blade models in a chassis.*

When you initially receive the chassis, the slots that can contain these blades are filled with blanks. A blank must be installed in each empty slot to ensure proper thermal management and regulatory compliance. To add a new blade, you first remove the blank from the corresponding slot and then insert the blade. Be sure to keep the blanks in case you need to change the blade configuration later. You should not operate the chassis for an extended period of time without all slots populated.

   **Important:** This product is sensitive to electrostatic discharge (ESD). *F5* recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

   **Note:** Ensure that you supply power to the chassis prior to installing any blades.

   **Note:** In the four-slot VIPRION 2000 Series chassis, you should install blades into the chassis in this order:

   - Upper left slot (1)
   - Lower left slot (2)
   - Upper right slot (3)
• Lower right slot (4)

Note: After you install a blade, wait approximately one to two minutes before installing another to ensure that each blade has sufficient time to boot. When the Status LED is green, the blade is fully booted.

Removing a blank

If a blank is installed in the slot where you want to install a blade, you must remove it. If the slot does not contain a blank, you can skip this procedure.

1. Select the slot in which you want to insert the blade.
2. Loosen the captive screws on either side of the blank with a #2 Phillips screwdriver, if necessary.
3. Grasp the two captive screws on the front of the blank and pull straight out to remove the blank from the chassis.

Removing a blade

You can remove a blade from the chassis without powering down the system.

1. Identify the blade that you would like to remove from the chassis.
2. Halt the blade:
   a) Connect to the blade using the serial console.
   b) Halt the blade.
      
      
      halt
      
      The blade is halted when the system displays: halted.

3. Disconnect all cables and remove any optical modules.
4. Loosen the captive screws on either side of the blade with an appropriate screwdriver, if necessary.
5. Grasp the two latches on the front of the blade and pull toward you.
6. Fully extend the latches on both sides of the blade and pull out toward you to remove the blade.

If you are not going to insert a replacement blade, you must install a blank in the open slot.

**Installing a blade**

Check if a blank is in the slot in which you want to install a blade. If so, you must first remove it.

You can install a blade in the chassis without powering down the system.

1. Fully extend the latches, located on each side of the blade, into the open position.
2. Carefully lift the blade and insert it into the empty slot.
3. Slide the blade into the slot until it is fully seated and the latches engage.

4. Tighten the captive screws clockwise until they are secured to the chassis completely.

**Important:** The captive screws must be tightened properly to ensure that the blade has a strong connection to the chassis.

5. Repeat this process with each blade until all blades are secured in the chassis.

**Note:** After you install a blade, wait approximately one to two minutes before installing another to ensure that each blade has sufficient time to boot. When the Status LED is green, the blade is fully booted.

---

**Connecting the cables and other hardware**

After you have installed the chassis into the rack, connect the cables and other hardware.

**Note:** Serial (hard-wired) failover is not currently supported between VIPRION chassis. If you would like to set up device service clustering (DSC®), previously known as a redundant system configuration, you must configure network failover. For more information, see BIG-IP Device Service Clustering: Administration at support.f5.com.

1. If you are using the default network configured on the management interface, connect an Ethernet cable to the management port.
2. Connect the platform to a serial console server.

**Important:** In the event that network access is impaired or not yet configured, the serial console might be the only way to access the chassis. F5 strongly recommends that you perform all installations and upgrades using the serial console, as these procedures require reboots, in which network connectivity is lost temporarily.

- Connect the serial console cable supplied by F5 to the CONSOLE port.

**Note:** The default baud rate and serial port configuration is 19200/8-N-1.

- Connect the RJ45F to RJ45M rolled serial adapter to the CONSOLE port if you are connecting the system to a serial console server with a standard CAT5 cable, and then connect the CAT5 cable to the adapter. The adapter provides the appropriate pinout connection to your equipment.

![Figure 11: The RJ45F to RJ45M rolled serial (pass-through) adapter](image)

3. Connect power to installed power supplies:

- For AC-powered systems, connect a power cable to the power input panel on all installed power supplies, and then connect the cable to the power source.
- For DC-powered systems, connect a DC cable to each power supply and then connect the cable to your DC mains power source.

You can now assign a cluster IP address to the system, and then license and provision the software.

Optionally, you should run the QKView utility. This utility collects configuration and diagnostic information about your system into a single file that you can provide to F5 Support to aid in troubleshooting. For more information, see [support.f5.com/csp/article/K1858](http://support.f5.com/csp/article/K1858).

---

**About cluster management**

The management IP address for a cluster is known as the cluster IP address. The cluster IP address enables you to access the browser-based Configuration utility to configure other aspects of the product, such as the product license, VLANs, trunks, and so on. Connecting to the cluster IP address connects you to the primary blade in the system.
With VIPRION® platforms, you assign cluster IP addresses on a per-cluster basis. Initially, all blades installed in the chassis belong to a single default cluster. During the initial setup, you only need to assign a single cluster IP address.

A blade within a cluster is known as a cluster member. You can assign a management IP address to each cluster member.

**Important:** When you configure an IP address for a blade, that IP address corresponds to the slot in which the blade resides. If you replace that blade with another, the new blade automatically receives the previously-configured management IP address, provided that a second operating blade is installed in the system. At least one operational blade is required at all time to preserve the existing configuration data.

You can manage clusters using these methods:

- USB LCD module
- `config` utility
- `tmsh` commands

### Configuring the cluster IP address from the LCD

You can use the USB LCD module to configure the cluster IP address. The options for cluster and blade management are located in the Cluster menu item under the System menu.

**Note:** The USB LCD module is an optional device that is not included with the platform by default. It works only with VIPRION® 2000 Series platforms.

**Note:** When using the LCD to manage clusters, be sure to use the Commit menu option after changing each setting. Alternatively, you can change all cluster-related settings and use the Commit option to save all settings at once.

1. Press the X button to access the LCD menus.
2. Use the arrow keys to select System and press the Check button.
3. Use the arrow keys to select Cluster and press the Check button.
4. Use the arrow keys to select Cluster Mgmt and press the Check button.
5. Use the arrow keys to select Cluster IP and press the Check button.

   The LCD panel shows the current IP address of the cluster. The default value is 192.168.1.246.

6. Use the arrow keys to configure the IP address of the cluster.
7. Press the X button until you return to the Cluster Mgmt menu.
8. Use the arrow keys to select Commit and press the Check button.

The system saves the new IP address for the cluster. You can now access the browser-based Configuration utility using the cluster IP address you assigned.

### Configuring the cluster IP subnet mask from the LCD

You can use the LCD module to configure the cluster IP subnet mask.

1. Press the X button to access the LCD menus.
2. Use the arrow keys to select System and press the Check button.
3. Use the arrow keys to select Cluster and press the Check button.

Platform Installation
4. Use the arrow keys to select **Cluster Mgmt** and press the Check button.

5. Use the arrow keys to select **Cluster IP Mask** and press the Check button.
   
   The LCD shows the current subnet mask address of the cluster. The default value is 255.255.255.0.

6. Use the arrow keys to configure the subnet mask of the cluster.
7. Press the X button until you return to the **Cluster Mgmt** menu.
8. Use the arrow keys to select **Commit** and press the Check button.

The system saves the new subnet mask for the cluster.

**Configuring the default gateway IP address for the cluster from the LCD**

You can use the LCD module to configure the default gateway IP address for the cluster.

1. Press the X button to access the LCD menus.
2. Use the arrow keys to select **System** and press the Check button.
3. Use the arrow keys to select **Cluster** and press the Check button.
4. Use the arrow keys to select **Cluster Mgmt** and press the Check button.
5. Use the arrow keys to select **Gateway** and press the Check button.

   The LCD shows the current gateway IP address of the cluster. The default value is 0.0.0.0.

6. Use the arrow keys to configure the gateway IP address of the cluster.
7. Press the X button until you return to the **Cluster Mgmt** menu.
8. Use the arrow keys to select **Commit** and press the Check button.

The system saves the new default gateway IP address for the cluster.

**Configuring the management IP address of a cluster member from the LCD**

You can use the LCD module to configure the management IP address of a cluster member.

1. Press the X button to access the LCD menus.
2. Use the arrow keys to select **System** and press the Check button.
3. Use the arrow keys to select **Cluster** and press the Check button.
4. Use the arrow keys to select **Cluster Mbrs** and press the Check button.
5. Use the arrow keys to select the appropriate blade (**Blade [1-4] Mgmt**) and press the Check button.
6. Use the arrow keys to select **Blade Mgmt IP** and press the Check button.

   The LCD shows the current IP address of the blade. The default value is 0.0.0.0.

7. Use the arrow keys to configure the IP address of the blade.
9. Use the arrow keys to select **Commit** and press the Check button.

The system saves the new IP address for the blade.

**Configuring the cluster IP address using the config utility**

You can configure the cluster IP address using the `config` utility after you connect a blade to a serial console.
1. Connect to the system using the serial console.
2. Start the config utility.
   
   config
   
   The config utility displays.
3. Follow the prompts to configure the cluster IP address, subnet mask, and gateway address for the management port.

The system saves the new IP address, subnet mask, and gateway address for the cluster. You can now access the browser-based Configuration utility using the cluster IP address you assigned.

**Configuring the cluster IP address using tmsh**

You can configure the cluster IP address using tmsh after you connect a blade to a serial console.

1. Connect to the system using the serial console.
2. Set the cluster IP address and subnet mask.
   
   tmsh modify sys cluster default address <ip_address/mask>
   
   Example: tmsh modify sys cluster default address 192.168.217.44/24
3. Set the default gateway for the cluster.
   
   tmsh modify sys management-route default gateway <gateway_ip>
   
   Example: tmsh modify sys management-route default gateway 172.20.80.254
4. Write the running configuration to the stored configuration files.
   
   tmsh sys save [base-config | config]

The system saves the new IP address, subnet mask, and gateway address for the cluster. You can now access the browser-based Configuration utility using the cluster IP address you assigned.

**Licensing the platform**

Once the cluster IP address is configured for the platform, you can use the browser-based Configuration utility to license the appropriate BIG-IP software.

1. Using a Web browser, navigate to the cluster IP address that you assigned to the VIPRION system.
   
   Use this format, where <cluster_ip_address> is the cluster IP address you assigned:
   
   https://<cluster_ip_address>
2. Type admin as the user name and admin as the password.
   
   If this is the first time you have accessed the Configuration utility, the first screen you see is the License screen.
3. Follow the instructions in the Configuration utility to license the platform.
   
   For more information about licensing the system, click the Help tab.
Verifying blade availability

At this point, you have installed the VIPRION platform, powered it, installed blades, assigned a cluster IP address to the system, and licensed it for use. Next, you need to ensure that the blades are recognized by the software and available for processing network traffic.

1. Using a Web browser, navigate to the cluster IP address that you have assigned to the VIPRION platform. The Configuration utility opens.
2. On the Main tab, click System > Clusters. The Clusters screen opens.
3. In the Cluster Members area, verify that all blades listed have a green status icon in the Status column. The green circle icon indicates that the cluster member is available.

Now you have installed a VIPRION platform successfully and prepared it for use on your network. The next steps involve further configuration of the platform by adding the trunks, VLANs, and self IP addresses that are necessary for the system to manage your network traffic effectively.
Platform Maintenance

About maintaining the platform

The VIPRION® 2400 platform contains several components that you can replace individually without exchanging the entire system. This platform contains these replaceable components:

- AC power supply
- DC power supply
- Fan tray
- Storage drive assembly

**Note:** Applies only to the B2100 blade with hard disk drive (HDD).

- Blades

About AC power supplies

The VIPRION® 2400 platform supports one to two hot swappable AC power supplies. The power supplies are auto-ranging from 100-127VAC to 200-240VAC input.

The platform supports power redundancy, which ensures that the system is unaffected if a single power supply fails in a system containing more than one power supply.

![Figure 12: A power supply partially removed from the platform](image)

**Caution:** Running without all power supplies installed in the platform can affect cooling and electromagnetic interference (EMI). If a power supply fails, you can leave it installed in the chassis and remove the power cord until you receive a replacement supply; the system, however, will continue to log errors.

**Caution:** The power socket outlet should be installed near the equipment and easily accessible.
**Important:** This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

**Note:** Depending on the model and revision type of the power supply, you might need either a Phillips or a slotted screwdriver to replace the power supply.

---

## Removing a power supply

Before you can replace a power supply, you must remove the existing supply from the chassis, if one is installed.

**Important:** If the chassis has at least one blade operating and you would like uninterrupted operation, make sure that one of the power supplies remains installed and operational during the replacement process.

1. On the front of the chassis, locate the power supplies.
2. Disconnect power from the power supply that you would like to remove.

**Note:** When you face the front of the chassis, power supply 1 is on the left, and power supply 2 is on the right.

3. Loosen the captive screw on the power supply eject lever with a #1 Phillips screwdriver, if necessary.
4. Raise the power supply eject lever.

5. Grasp the lever and pull straight toward you to eject the power supply from the power supply bay.

## Installing a power supply

If a power supply is already installed in the bay where you are installing the replacement supply, disconnect power from the power supply prior to removing the supply. When you face the front of the chassis, power supply 1 is on the left, and power supply 2 is on the right.

You can add or replace a power supply as part of routine maintenance or in the event of a power supply failure.
**Important:** If the chassis has at least one blade operating and you would like uninterrupted operation, make sure that one of the power supplies is installed and operating during the replacement process.

1. Remove the existing supply, if one is installed.
2. Slide the new power supply into the empty power supply bay.
3. Lower the power supply eject lever to fully seat the power supply in its bay.
4. Secure the power supply in its bay by tightening the screw in the middle of the power supply eject lever.

**Note:** The screw that holds the ejector handle in place is captive and cannot be removed from the assembly.

After you install the power supply, you can apply power to it.

---

**About DC power supplies**

The VIPRION® 2400 platform supports up to two hot swappable DC power supplies.

The platform supports power redundancy, which ensures that the system is unaffected if a single power supply fails in a system containing more than one power supply. The DC power supply includes a DC input connector, which is composed of a DC lock assembly and a DC plug. Connect the wires from the DC power source to the DC input connector, and then insert the connector into the DC power supply.

The DC power supply does not have an on/off switch. You can control the power from the rack switch or the DC power source.

**Caution:** Before installing a DC power supply, be sure that the DC power source for the rack is powered off.

**Caution:** Running without all power supplies installed in the platform can affect cooling and electromagnetic interference (EMI). If a power supply fails, you can leave it installed in the chassis and remove power from the power supply until you receive a replacement supply; the system, however, will continue to log errors.

**Caution:** Before you begin to work with one of these platforms, refer to the DC-powered equipment environmental warnings for this platform and review any safety requirements for the facilities where the DC-powered platforms will be installed.

**Important:** This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

**Important:** The platform must be installed in a RESTRICTED ACCESS LOCATION, such as a central office or customer premises environment.

**Note:** All copper grounding cable must meet all appropriate safety standards and local electric codes.

**Note:** You should coat bare conductors with an appropriate antioxidant compound before you make crimp connections. You should bring all unplated connectors, braided strap, and bus bars to a bright finish and then coat them with an antioxidant before you connect them.
Removing a power supply

Before you can replace a power supply, you must remove the existing supply from the chassis, if one is installed.

**Important:** If the chassis has at least one blade operating and you would like uninterrupted operation, make sure that one of the power supplies remains installed and operational during the replacement process.

1. On the front of the chassis, locate the power supplies.
2. Disconnect power from the power supply that you would like to remove.

**Note:** When you face the front of the chassis, power supply 1 is on the left, and power supply 2 is on the right.

3. Loosen the captive screw on the power supply eject lever with a #1 Phillips screwdriver, if necessary.
4. Raise the power supply eject lever.

5. Grasp the lever and pull straight toward you to eject the power supply from the power supply bay.

Installing a DC power supply

If a power supply is already installed in the bay where you are installing the replacement supply, disconnect the DC power for the power supply prior to removing the supply. When you face the front of the chassis, power supply 1 is on the left, and power supply 2 is on the right.

You can add or replace a DC power supply as part of routine maintenance or in the event of a power supply failure.

**Important:** If the chassis has at least one blade operating and you would like uninterrupted operation, make sure that one of the power supplies remains installed and operational during the replacement process.
1. Remove the existing supply, if one is installed.
2. Slide the new DC power supply into the empty power supply bay.
3. Lower the power supply eject lever to fully seat the power supply in its bay.
4. Secure the power supply by tightening the captive screw on the power supply eject lever.

**Note:** The screw that holds the ejector handle in place is captive and cannot be removed from the assembly.

---

**Wiring the DC connector**

You will need these components to wire the DC power supply:

- Wire stripping tool
- Two 6 AWG copper wires long enough to reach from the platform to the DC power source

The DC power supply for the VIPRION® 2400 platform includes the components needed to assemble the DC connector: a DC lock assembly and a DC plug.

![Figure 13: VIPRION 2400 DC power supply, lock assembly, and plug](image)

1. Use the wire stripping tool to remove 3/8 inch (9.56 mm) of insulation from the end of each 6 AWG wire.
Important: Be sure to remove the appropriate amount of insulation from each wire. If you remove too much insulation, exposed wire protruding from the DC plug can create an electrical hazard. If you do not remove enough insulation, the wire might not make proper contact with the terminal.

2. Thread the exposed conductor ends of the wires through the opening in the lock assembly.
3. Insert the exposed red (+) and black (-) conductors into the appropriate connectors on the DC plug. Insert a small flat-head screwdriver into the corresponding release hole on the DC plug to allow the conductor to be freely inserted into the contact opening.

4. Snap the plug into the lock assembly.

Connecting DC power to the platform

Important: Be sure that the DC power source is off and the ground lug is connected to the ground terminal before you connect the platform to the DC power source.

After you have assembled the DC input connector, you can connect the platform to the DC power source. When you connect the DC power source, you should also follow the safety requirements defined for your network operations center (NOC).
1. Plug the assembled DC input connector into the outlet of the DC power supply and press firmly until it is fully seated.
   If the connector does not readily insert into the power supply, you might need to manually align it.

2. Secure the DC input connector to the power supply by tightening the captive screw clockwise until it is secured to the power supply completely.

   Note: The top screw secures the DC input connector to the power supply, and the bottom screw secures the power supply to the chassis.

3. Connect the DC power cord to an approved power source.
   For more information about voltage input requirements, see Chassis hardware specifications.

4. Repeat this process for each power supply in the chassis.
5. Guide the power cables through the cable routing brackets.
6. Attach the cable management covers to the cable routing brackets by using a #2 Phillips screwdriver, if necessary.
7. Power on the DC power source.
   The system begins to boot.

About the fan tray

The VIPRION® 2400 platform has a removable fan tray that is designed to maintain airflow throughout the chassis. You can change or replace the fan tray as part of the routine maintenance of the unit, or in the event of a fan failure. The fans in the fan tray run constantly while the unit is on. Over time, the fans can wear out, requiring you to replace the fan tray.

Important: This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.
Replacing the fan tray

You can replace the fan tray as part of routine maintenance or in the event of a fan tray failure. You do not need special tools to replace the fan tray. You do not need to power down the unit when replacing the fan tray; however, do not leave the unit operating without a fan tray for longer than 30 seconds.

**Caution:** Operating the unit without a fan tray for more than 30 seconds might cause permanent damage.

1. Stand at the back of the platform and locate the ejector handles on the left and right sides of the fan tray.
2. Extend the fan tray handles and remove the fan tray from the chassis by pulling straight toward you.
3. Place the new fan tray into the fan tray bay.
4. Push the fan tray into the chassis until it is seated firmly in the fan tray bay.
   When seated, the fan tray automatically powers up and begins circulating air through the chassis.

**Important:** Use only the fan tray handles to seat the fan tray in the chassis. Using the edges of the fan tray could result in pinched fingers.

About the storage drive assembly

By default, VIPRION® B2000 Series blades contain one storage drive assembly that contains either one hard disk drive (HDD) or one solid-state drive (SSD).
**Important:** This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

**Replacing a storage drive assembly**

You can change or replace a storage assembly that contains a storage drive (hard disk drive or solid-state drive) in a VIPRION® B2000 Series blade as part of the routine maintenance of the unit or in the event of a drive failure.

1. Remove the blade from the chassis that contains the drive assembly to be replaced.
2. Remove the existing drive assembly, if one is installed:
   a) Loosen the drive assembly screw by turning it counterclockwise with a Phillips screwdriver, if necessary.

   **Note:** The screw that holds the ejector handle in place is captive and cannot be removed from the assembly.

   b) Grasp the screw, lift the drive assembly slightly, and then rock the connector gently from side-to-side as you pull to remove the hard drive assembly from the blade.

3. Slide the new drive assembly into the bay.
   Be sure to place the bottom of the assembly under the cable connectors.
4. Tighten the screw into place.
   The drive assembly is connected to the system when you tighten the screw completely.

5. Place the blade back into the chassis.
Environmental Guidelines

General environmental guidelines

The VIPRION® 2400 platform is an industrial network appliance that is designed to be mounted in a standard 19-inch EIA rack. Follow these guidelines to adhere to safety precautions:

- Install the rack according to the manufacturer's instructions and check the rack for stability before placing equipment in it.
- Build and position the rack so that once you install the platform, the power supply and the vents on both the front and back of the unit remain unobstructed. The platform must have adequate ventilation around the unit at all times.
- Do not allow the air temperature in the room to exceed 104°F (40°C).
- Do not plug the unit into a branch circuit shared by more electronic equipment than the circuit is designed to manage safely at one time.

**Important:** This product is sensitive to electrostatic discharge (ESD). F5 recommends that you use proper ESD grounding procedures and equipment when you install or maintain the unit.

**Caution:** Customers should not attempt to replace batteries. There is a risk of explosion if a battery is replaced with an incorrect type. Field technicians should dispose of used batteries according to the instructions.

**Attention:** Il y a risque d'explosion si la batterie est remplacée par une batterie de type incorrect. Mettre au rebut les batteries usagées conformément aux instructions.
Guidelines for the AC-powered platform

An AC-powered installation must meet these requirements:

• Install the unit using a 20 amp external branch circuit protection device.
• Normally, one power feed is used for each individual power supply.

**Important:** The platform must be installed in a RESTRICTED ACCESS LOCATION, such as a central office or customer premises environment.

**Note:** The power cables included with this unit are for exclusive use with this unit and should not be used with other electrical appliances.

**Note:** These guidelines apply to STATIONARY PLUGGABLE EQUIPMENT TYPE A with simultaneous multiple connections to the AC MAINS SUPPLY:

• The building installation shall provide a means for connection to protective earth; and
• The equipment is to be connected to that means; and
• A SERVICE PERSON shall check whether or not the socket-outlet from which the equipment is to be powered provides a connection to the building protective earth. If not, the SERVICE PERSON shall arrange for the installation of a PROTECTIVE EARTHING CONDUCTOR from the separate protective earthing terminal to the protective earth wire in the building.

**Note:** High leakage current. Earth connection essential before connecting supply.

Guidelines for the DC-powered platform

A VIPRION® DC-powered installation must meet these requirements:

• Install the unit using a 50 amp external branch circuit protection device.
• One power feed must be used for each individual power supply.
• For permanently connected equipment, incorporate a readily accessible disconnect in the fixed wiring.
• Use only copper conductors.
• The DC MAINS powering the equipment shall be connected to protective earth.

**Important:** The platform must be installed in a RESTRICTED ACCESS LOCATION, such as a central office or customer premises environment.

**Note:** The power supply for the VIPRION® DC platform does not have an on/off switch. You control the power from the DC power source.

**Note:** You must use copper wire for the ground wire and all lead wires.

**Note:** You should coat bare conductors with an appropriate antioxidant compound before you make crimp connections. You should bring all unplated connectors, braided strap, and bus bars to a bright finish, and then coat them with an antioxidant before you connect them.

---

**Platform airflow diagram**

When you install the platform into a rack, it is important to understand the unit’s airflow direction so that you can ensure proper cooling.

The platform employs a negative pressure fan system, which draws cold air in from the front of the chassis and exhausts hot air out the back of the chassis.
Figure 15: Airflow in the VIPRION 2400 platform
## Platform Specifications

### General specifications for system features

This table lists general specifications for the VIPRION® 2400 platform.

<table>
<thead>
<tr>
<th>Item</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transceiver modules hot swap</td>
<td>Support for hot swap of transceiver modules</td>
</tr>
<tr>
<td>Dynamic routing protocols</td>
<td>BFD, BGP4, IS-IS, OSPFv2, OSPFv3, RIPv1/RIPv2, RIPng</td>
</tr>
<tr>
<td>Jumbo frames</td>
<td>Support for maximum Ethernet frame size of 9216 bytes and MTU of 9128 bytes</td>
</tr>
<tr>
<td>Virtual Clustered Multiprocessing™ (vCMP™)</td>
<td>Supports provisioning and managing multiple, hosted instances of the BIG-IP software on a single hardware device</td>
</tr>
</tbody>
</table>

*Important: Specifications are subject to change without notification.*

### Blade hardware specifications

This table lists hardware specifications for VIPRION B2000 Series blades.

<table>
<thead>
<tr>
<th>Specification</th>
<th>B2100</th>

</thead>
<tbody>
<tr>
<td>Operational temperature</td>
<td>32° to 104°F (0° to 40°C)</td>
</tr>
<tr>
<td>Operational relative humidity</td>
<td>5 to 85% at 104°F (40°C)</td>
</tr>
<tr>
<td>Non-operational temperature</td>
<td>-40 to 158°F (-40 to 70°C)</td>
</tr>
<tr>
<td>Non-operational humidity</td>
<td>5 to 95% at 40°C non-condensing</td>
</tr>
</tbody>
</table>

**Important:** Specifications are subject to change without notification.
About AC power requirements

When working with an AC-powered VIPRION® platform, it is important to understand the AC power options and requirements.

About AC power cables

The power cable supplied with the hardware is a 220V high-line input cable. This type of cable requires a NEMA 6-20R wall outlet or a region-specific equivalent. Region-specific power cables are available from F5® Networks.

Note: The power cables included with this unit are for exclusive use with this unit and should not be used with other electrical appliances.

AC power redundancy provisioning

This VIPRION® platform supports up to two AC power supplies. The power supplies are auto-ranging 100-127VAC (low-line) to 200-240VAC (high-line) input, and can supply 1200W output power at low-line and 1400W output power at high-line. The fan tray is provisioned to draw up to 100W. Each slot is provisioned to draw up to 275W, if needed; therefore, one power supply with low-line input can support one, two, three, or four B2000 Series blades, plus the fan tray with no redundancy. The same supply with high-line input can also support up to four B2000 Series blades. If redundancy is desired in any configuration, simply add the second power supply at either low- or high-line input. This table shows some of the possible blade and power supply redundancy configurations.

DC power requirements

When working with a DC-powered VIPRION® 2400 platform, it is important to understand the DC power options and requirements.

The platform supports up to two hot swappable DC power supplies. One power supply powers a chassis that contains zero to four blades, with no redundancy. Two power supplies power a chassis with any blade configuration, with full redundancy.

DC platform power consumption

The actual amount of power draw from the DC power source depends on the type and number of blades, and the redundancy configuration. This table shows several possible configurations, and the typical and maximum power draw.

**Safety requirements**

This equipment complies with these safety requirements of the Low Voltage Directive 2006/95/EC.

EC Type Examination Certificates:

- EN 60950-1:2006 + A11:2009
- CB Scheme
- UL 60950-1 2nd Edition, CSA C22.2 No. 60950-1-07

Important: Specifications are subject to change without notification.

**EMC requirements**

**USA--FCC Class A, Canada--Industry Canada Class A**

This equipment complies with Subpart B of Part 15 of FCC Rules for Class A digital devices, Industry Canada ICES-003, Issue 5. Operation is subject to these two conditions:

- This equipment may not cause harmful interference.
- This device must accept any interference received, including interference that may cause undesired operation.

**European Union**

This equipment complies with these requirements of the EMC Directive 2004/108/EC:

As Telecommunication Network Equipment (TNE) in Both Telecom Centers and Other than Telecom Centers per (as applicable):

**Important:** Specifications are subject to change without notification.

---

1. All measurements taken at 0.6 meter with two power supplies operational and fans at 100% duty cycle. Measurements recorded in decibels A-weighting (dBA).
2. Per BELCORE GR-63-CORE, section 4.1.3: This unit is functional when installed at elevations between 60m (197 feet) below sea level and 1800m (6000 feet) above sea level at the aisle ambient temperatures of 40°C.
3. Fan tray airflow measurements taken at 100% duty cycle and in open air.
China RoHS Requirements

RoHS declaration

The object of this declaration is in conformity with Directive 2011/65/EU of the European Parliament and of the Council of 8 June 2011 on the restriction of the use of certain hazardous substances in electrical and electronic equipment.

Hazardous substance levels for China

This table shows how the VIPRION® 2400 platform components conform to the Restriction of Hazardous substances Directive (RoHS) standards for China.
### VIPRION C2400 Chassis Hazardous Substance Table

<table>
<thead>
<tr>

* 表示该有毒有害物质在该部件所有相关材料中的含量均在 SJ/T 11363-2006 标准规定的限值要求以下

* 表示该有毒有害物质至少有该部件的某一相关材料中的含量超过 SJ/T 11363-2006 标准规定的限值要求

（企业可在此处，根据实际情况对上表中“x”的技术原因进行进一步说明）

Expresses that this hazardous substance is below the specified limits as described in SJ/T 11363-2006.

Expresses that this hazardous substance is above the specified limits as described in SJ/T 11363-2006.

### 例外说明

除非另外特别的标志，此标志为针对所涉及产品的环保使用期标志，某些部件会有一个不同时限的环保使用期（例如电池单元模块）贴在其产品上。

此环保使用期只适用于产品在正常工作环境下使用。

The Environmentally Friendly Use Period (EFUP) for all enclosed products and their parts is per the symbol shown here, unless otherwise marked. Certain parts may have a different EFUP (for example, battery modules) and so are marked to reflect such. The Environmentally Friendly Use Period is valid only when the product is operated under the conditions defined in the product manual.
Repackaging Guidelines

About repackaging the platform

The VIPRION® 2400 chassis and blades are designed to be shipped and packaged separately. If it becomes necessary to transport the platform to another location or return it to F5® Networks, these guidelines will help ensure that you repackage the platform properly.

**Important:** Before returning any equipment, contact F5 to obtain a Return Material Authorization (RMA) case number.

**Important:** You must use shipping materials and packaging provided by F5 when repackaging the platform.

**Note:** Be sure to keep a record of the tracking number and ship date. These will be needed to track lost shipments.

**Note:** Do not include any cables, removable XFP/SFP/SFP+ modules, GBICs, or other peripheral items if you are returning the platform to F5 Networks.

Repackaging the chassis

The VIPRION® 2400 chassis must be shipped empty (with no blades installed) and in F5®-provided packaging.

1. Disconnect the power cords and other cables from the platform.
2. (Optional) Install the chassis handles if they are not already installed to help ease removal of the chassis from the rack.
3. Remove all blades from the chassis.
4. Remove the chassis from the rack.
5. Place the empty chassis onto the shipping box.
6. Cover the chassis with the plastic wrap.
7. Place the foam insert on top of the chassis.

8. Place the accessory box on the foam insert.

9. Close and seal the shipping box.
Repackaging a blade

The VIPRION® B2000 Series blades must be shipped in F5-provided packaging.

1. Disconnect the network cables and other cables from the blade, and then remove any optical modules.
2. Loosen the captive screws on either side of the blade.
3. Grasp the two latches on the front of the blade and pull toward you.
4. Fully extend the latches on both sides of the blade and pull out toward you to remove the blade from the chassis.
5. Place the blade into the antistatic bag, and then place the bagged blade into the black conductive wrapper sheet.
6. Close the black wrapper sheet by securing the tabs on the left and right sides of the box.

7. Place the foam cover on top of the blade box.

8. Close the blade box.
9. Install the foam end caps onto the outside edges of the blade box, and then place the blade box into the outer shipping box.

10. Close and seal the outer shipping box.
About returned material data security

Follow these data security guidelines when returning equipment to F5® for reprocessing or repair. The guidelines include reprocessing procedures and optional customer-end procedures.

About memory technologies used in F5 equipment

F5® equipment contains volatile, battery-backed volatile, and non-volatile memory. Volatile memory loses all traces of data on power down. Battery-backed volatile memory retains data as long as battery charge is maintained. Non-volatile memory retains data indefinitely.

Volatile memory

Volatile memory loses all traces of data on power down; therefore, customer data that is stored in volatile memory is secure when power is removed from the platform. No further action is required by customers for equipment that includes volatile memory.

Battery-backed volatile memory

This F5® platform contains a coin battery for maintaining BIOS settings and the system clock. All data maintained by the coin battery is used only for system specific tasks. No customer data is maintained by the battery-backed volatile memory. No further action is required by customers for equipment that includes volatile memory.

Non-volatile memory

F5® platforms include various non-volatile memory components. These non-volatile memory components can be categorized as either user inaccessible or user accessible.

Inaccessible non-volatile memory components are programmed during manufacture or software installation. The data stored in user inaccessible non-volatile memory is used for setting voltage levels, determining the sequence of operational events, and the managing appliance operational condition. Data held within user inaccessible, non-volatile memory represents no data security risk to customers. User inaccessible, non-volatile memory cannot be modified by appliance users, and therefore, contains no customer data.

Inaccessible non-volatile memory

This table lists the inaccessible non-volatile memory in this system.
### Accessible non-volatile memory

This table lists the accessible non-volatile memory in this system. Not all platform variants include all of these non-volatile memory items.

### About removing data from F5 components

For components that contain sensitive customer data and cannot be removed from your F5® system, you can take optional steps to remove the data from these components before you return the system to F5 for processing.

### Removing sensitive data from storage drives

The hard disk drive (HDD) and solid-state drive (SSD) components included in F5® platforms might include sensitive customer data. If you purchase the HDD removal SKU, you can remove the HDD/SSD and coin battery, and these components will be replaced during F5 reprocessing. Otherwise, HDD and SSD components are processed by F5 through standard processing. You can perform a disk erase operation on your system to remove sensitive customer data.

Perform a disk erase operation using one of these methods:

- On systems running BIG-IP® software version 11.6.0 and later, you can use the F5 Disk Erase utility to remove all data on hard disk drives (HDDs) or solid-state drives (SSDs) using a single-pass, zero write disk erase operation. For more information, see support.f5.com/csp/article/K15521.
- On systems running earlier versions of BIG-IP software, you can create and use a bootable USB drive to rebuild the system with a clean image of BIG-IP software. This runs a disk erase operation.
Removing IP address data from Always-On Management

If you have configured an IP address for the Always-On Management (AOM) subsystem, you can remove the customized IP address from the system before returning it to F5® Networks.

1. Connect to the system using the serial console.
2. Open the AOM Command Menu.
3. Assign a new management IP address, netmask, and gateway:
   - To use DHCP to assign the addresses, type y when prompted about using DHCP.
   - To manually assign the addresses, type n when prompted about using DHCP. At the prompts, type values for IP address (required), netmask (required), and gateway (optional).

A confirmation message displays the configured management IP address, netmask, and gateway.
4. (Optional) Type i to verify the assigned addresses.

Removing sensitive data from an internal hardware security module (HSM)

If the system includes an internal hardware security module (HSM), also referred to as a FIPS card, you can remove the sensitive customer data from HSM before returning it to F5® Networks.

**Important:** The HSM cannot be removed from the platform.

1. Use the Configuration utility to delete all key/certificate pairs.
   a) On the Main tab, click System > File Management > SSL Certificate List.
      This displays the list of certificates installed on the system.
   b) Select the certificates that you want to delete and click Delete.

   This removes all .crt, .exp, and .key files from the system.
2. Log in to the command line of the system using an account with root access.
3. Initialize the HSM and reconfigure it using fictitious data.
   run util fips-util -f init

For more information on using this command on a FIPS platform, see BIG-IP® Platform: FIPS Administration at support.f5.com.

**Important:** This deletes all keys and makes any previously exported keys unusable.

Export Regulation Notice
This product may include cryptographic software. Under the Export Administration Act, the United States government may consider it a criminal offense to export this product from the United States.

RF Interference Warning
This is a Class A product. In a domestic environment this product may cause radio interference, in which case the user may be required to take adequate measures.

FCC Compliance
This equipment has been tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This unit generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case the user, at his own expense, will be required to take whatever measures may be required to correct the interference.

Any modifications to this device, unless expressly approved by the manufacturer, can void the user's authority to operate this equipment under part 15 of the FCC rules.

Canadian Regulatory Compliance
This Class A digital apparatus complies with Canadian ICES-003.
Standards Compliance

This product conforms to the IEC, European Union, ANSI/UL and Canadian CSA standards applicable to Information Technology products at the time of manufacture.

Brazil Compliance

This product is homologated by ANATEL, in accordance with the procedures regulated by Resolution n. 242/2000 and meets the technical requirements applied.

This product is homologated by ANATEL, in accordance with the procedures regulated by Resolution n. 242/2000 and meets the technical requirements applied including the exposure limits of the Specific Absorption Rate for electric, magnetic and electromagnetic fields of radio frequency in accordance with Resolutions 303/2002 and 533/2009.

This equipment is not subject to the protection from harmful interference and may not cause interference with duly authorized systems.

For more information, see the ANATEL website at www.anatel.gov.br.

VCCI Class A Compliance

This is a Class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take corrective actions. VCCI-A
